

6. De uurgemiddelde-grafieken

In de nu volgende grafieken is het uurgemiddelde per 7-daagse periode per deelgebied uitgezet. hierbij is het uurgem. van N-waarts vliegende vogels boven de abscis uitgezet, van de Z-waarts vliegende vogels onder de abscis. Van alle soorten zijn de uurgem. van ZH en NH gegeven resp. boven en onder. In Wd is te weinig geteld om dit grafisch weer te geven. Perioden met minder dan 6 uur zijn weergegeven met *. Onder alle figuren is per deelgebied het presentie-percentage per maand vermeld. Hierbij is het aantal uren, waarin de soort werd gezien, uitgedrukt als percentage van het totaal aantal waarnemingsuren in die maand.

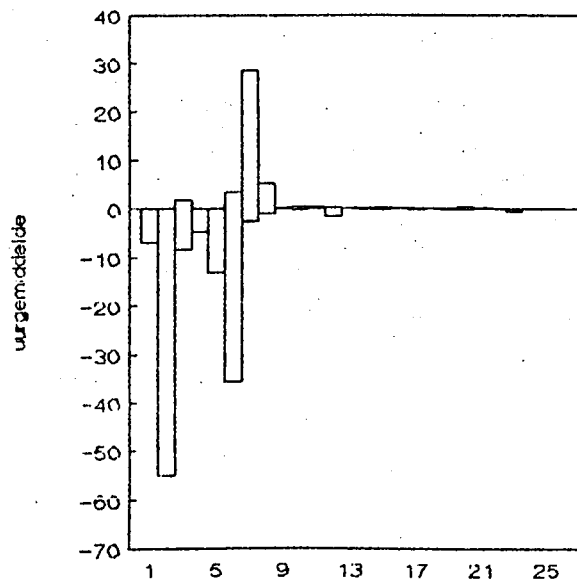

In the figures the mean numbers of birds per hour per 7-day period for the coastal regions ZH (upper) and NH (lower) are given. In these figures the mean number of birds flying N are plotted above the abscis, while the mean number of birds flying S are plotted below the abscis. Periods in which less than 6 hours were available are marked *. Below each region figure the percentage of presence is given for each month. These were obtained by dividing the number of observation-hours in which the species was seen by the total number of observation-hours for that month. Thus this value gives an indication of the likelihood of encountering a certain species in a particular month in a particular region.
