

6. Uurgemiddelde-grafieken

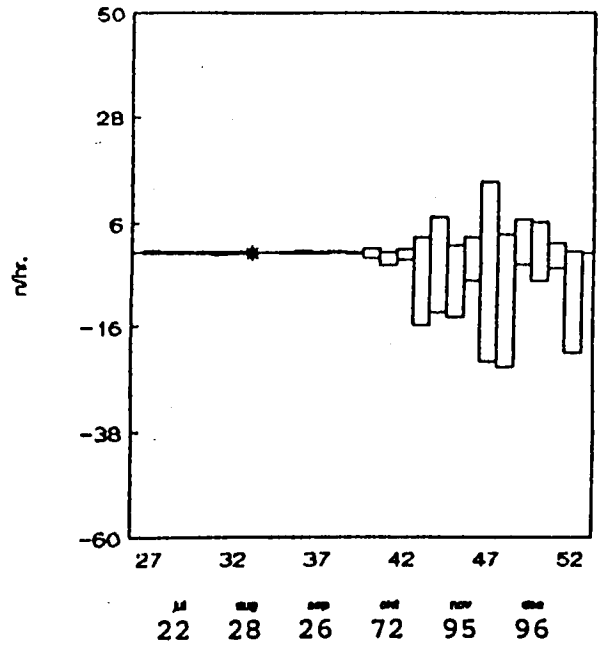

In de volgende figuren wordt het seizoenspatroon van een aantal soorten weergegeven middels uurgemiddelden per standaardweek. Noordwaarts vliegende vogels zijn boven de horizontale as uitgezet. Zuidwaarts vliegende vogels eronder. In de figuren worden alleen de resultaten van NH & ZH gepresenteerd. De gegevens van Wd waren te fragmentarisch. Weken, waarin 5 uur of minder is geteld zijn aangegeven met een asterike (*). Onder de figuren is het presentiepercentage-het aantal uren, waarin een soort is gezien, uitgedrukt als percentage van het totaal aantal waarnemingsuren-per maand vermeld.

In the following figures the seasonal pattern of a number of species is presented, expressed as hourly averages per week. The data above the horizontal abscis refer to birds flying north. The data below this abscis to birds flying south. Due to an uneven coverage in Wd the figures are restricted to NH & ZH. Weeks with 5 or less observation-hours are marked with an asteriks (*). Below the figures the percentage of presence is given for each month. This percentage expresses the ratio of hours in which a species is recorded and the total number of observation-hours.
